) When a signed JAR file, a disabled algorithm or key size below minimum length is used with signature verification operations, the signature will be ignored and treat the JAR file as if it were unsigned.. Without a clear indication of the behavior of this method, the risk of the key diversion function does not have a security feature expected from the client.. B) Implement the following simple key diversion function: 1) Call KeyAgreement generateSecret () to get the shared secret as a byte array, 2) Hash byte array which was formed in step 1 with SHA-256 3) pass in step 2, a byte array is made to the constructor of SecretKeySpec.
